

Collaboration between universities and the business sector is of more and more strategic importance. Around the world, prominent universities are giving top priority to co-operation with non-educational organizations in research projects. The key to such projects' success is effective transformation of academic research into knowledge that business can put into commercial use.

RAMSIS is the ideal platform to support the valorization of your ergonomic knowledge.

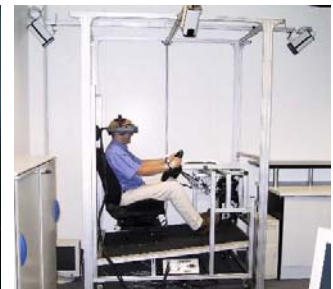

RAMSIS was designed by and for the automotive industry. Its purpose is to allow automotive designers to address perform ergonomic design evaluations in the early CAD stages of the design process. More than 70% of automotive manufacturers worldwide use RAMSIS.

RAMSIS is compatible with major CAD systems, as well as with body scanners, motion tracking systems and VR environments. RAMSIS is the ideal platform for your research laboratory - to valorize your knowledge and strengthen your relationship with the industry.

Fierce competition, especially among automotive manufacturers, has resulted in companies giving priority to ergonomic factors in their vehicle design. Examples of the most important competitive differentiators are increased active safety, comfort and ease of use. Ergonomics is a dynamic science that involves intensive research and gets extensive input from the academic community. It can only be applied by the industry with the continuous support of universities.

And also important: by integrating RAMSIS in your educational program, you are training students to use tools and methods that are standard in the industry, thus enhancing their career prospects.

RAMSIS is a collaborative platform. Customers and researchers are constantly feeding the software with their existing knowledge and new research. This ensures that, at all times, RAMSIS is state of the art.
